Statistics: Mean 7.030; Variance 1.506; scale 4.668

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

REFERENCE

(bases 1 to 443)

ORGANISM

Homo sapiens

RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library

host=DH10B (ampicillin resistant) Rsite1=Not I Rsite2=Eco RI 19 human clone=298028 primer=m13 -40 forward library=Soares fetal lung

1st strand cDNA was primed with a Not I - oligo(dT)

with a modified polylinker

week fetus.

NbHL19W vector=pT7T3D (Pharmacia)

double-stranded cDNA was size selected, ligated to Eco RI adapters

(Pharmacia), digested with Not I and cloned into the Not I and Eco

constructed by Bento Soares and M.Fatima Bonaldo.

Statistics: Mean 5.939; Variance 3.336; scale 1.780

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                   using primers MM082 and MM083 and plasmid pl1-4 as a template. The 129 bp amplified fragment contains the 3' end of the H6 promoter, the 5'-most bases of the murine p53 gene, and 15 bp which overlap fragment III. Fragment III was produced using primers MM084 and MM085 and plasmid pl1-4 as a template. The 301 bp amplified fragment contains the 3' end of the p53 gene, and the 5' end overlaps fragment II. The three PCR products were pooled and primed with MM080 and MM085. The resultant 588 bp fragment contains a BamHI site followed by H6 promoted p53. This was inserted into pNC5LSP5 to generate plasmid pMM148 containing H6 promoted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         murine; interleukin-2; II-2; pRW825; pmut-1; pBS-SK; pMM151; TK vector; plasmid; vaccinia; H6 promoter; amplify; primer; antigenic response; polymerase chain reaction; poxvirus; pSD542; immunological response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the wildtype murine p53 gene from the translation initiation codon to the stop codon. This sequence was used in the construction of an ALVAC-based recombinant virus containing the wild-type murine p53 gene. Three PCR fragments were generated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             JT 2

It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Human p53 cDNA (given in Q97854) was amplified from a HeLa ce. CDNA library using the primers given in Q97852-53. The gene was subcloned into a baculovirus vector for expression of recombinant p53 in Sf9 insect cells for use as a component of

                                                                                                                                                                                                 virus produced recombinant virus vCP270, which contains the vaccinia H6 promoted mutated human p53 in the C5 locus. The resulting virus may be
                                                                                                                                                                                                                                      position 524, changing an Arg residue at position 175 to a His residue. The plasmid pMMIIO (see also 067884) contains the vaccinia H6 promoter and the wild type human p53 gene in the ALVAC C5 insertion site. The mutant p53 gene was obtained from plasmid Cx22A and cloned into pMMIIO to generate pMMI43. Recombination between pMMI43 and ALVAC rescuing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1182 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               colon carcinoma, lymphoma, leukaemia, etc., suggesting that mutation of the pS3 genes is involved in oncogenesis. The viruses may be used in a composition for inducing an antigenic immunological response, ie. for immunisation against pathogens. Sequence 1483 BP; 367 A; 415 C; 372 G; 329 T; mutant genes were derived from plasmids p53wtXbaISP6/T3, p53-21XbaI and p53-238XbaI respectively. The vaccinia H6 promoter was derived from plasmid pRW825 and precisely linked to the 5'-most region of the p53 Polymerase chain reaction; primer; amplify; NYVAC; ALVAC; recombinant; human; p53; wild type; mutant; p53wtXbaISP6/T3; p53-21XbaI; p53-238XbaI; vaccinia; H6 promoter; plasmid; pRW825; expression cassette; Q67864; plasmid, ALVAC, to give vCP207, vCP193 and vCP191 recombinant gene. The expression cassettes generated by linking the vaccinia H6 promoter and the p53 genes may be cloned in to the poxvirus insertion construction of poxvirus based recombinant viruses expressing wild type and mutant forms of the human p53 gene product. The wild type and containing the vaccinia H6 promoter and the wild type human p53 gene in vP1101 and vCP207, respectively. These sequences were used in the DNA encoding cytokine and/or tumour associated antigen Example 15; Fig 18; 232pp; English.

PT Fusion proteins for prodn. of e.g. pro-insulin - comprise gene

PT for desired protein and oligo-nucleotide(s) encoding ballast

PS Claim 9; Column 30; 22pp; English.

CC This preferred mixed oligonucleotide encodes a ballast constituent

CC and is inserted between a regulatory region and the structural gene

CC component improves protease resistance of the fusion protein while

CC still allowing the desired protein to adopt its correct conformation

CC prior to cleavage of the ballast constituent.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human neuroblastoma cell line, hippocampus, frontal and temporal cortex and visual cortex CDNA banks were screened with a probe containing carp skeletal muscle Ca-channel cDNA. The cDNA clone pCA9.3 was sequenced. The 5'end of the clone begins directly after Domain I (amino acid 337) and the 3'end is at amino acid 922. The
                                                                                                                                                            and IV and part of the C-terminus coding sequence. The human neuronal calcium channel protein can be used for screening for Cachannel ligands (agonists or antagonists). See also Q29259-Q29275

                                      Numerous alpha IC-specific DNA clones were isolated. Characterisation of the sequence revealed the alpha IC coding sequence, the alpha IC initiation of translation sequenc, and an alternatively spliced region of alpha IC. Q37814 and Q37815 encode

Full-length clones were then constructed by ligating partial clones. Q84653 shows the nt sequence of the CDNA encoding the alpha 1D subunit. The Albha 1D protein has a calculated Mr of 245,163. It contains four putative internal repeated sequence regions which represent 24 putative transmembrane segments. It mediates DHP-sensitive high-voltage, long-lasting

Numerous alpha 1c-specific cDNA clones were isolated in order to characterise the alpha 1c coding sequence, the initiation of translation and an alternatively spliced region. Q84655 sets forth one alpha 1c coding sequence (alpha 1c-1) and R71003 sets out its deduced AA sequence. Q87834 and R72607 set out another

i	DNA encoding tulip allacyl amidase - useful in chemical selection and	
Š	prodn. of nerbicide resistant plants. Disclosure; Fig 3; 11pp; Japanese.	
ದ ದ	Crude allylacyl amidase was prepd. from tulip bulbs and purified by dialysis. DEAE cellulose chromatography, gel filtration and	
; K	hydroxyapatite chromatography. The purified protein was partially	
K K	digested by Lysyl endopeptidase and the protein fragment sept. by SDS-PAGE. The amino acid sequence was determined and the crude	
888	ein used to prepare rabbit ant en a cDNA library, constructed	
8 8	poly $\mathtt{A}$ + RNA. The base sequence and corresp. amino acid sequence were then determined.

                                                                                                                                                         infected tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV cDNA library. Clones were rescued from the lambda phage, searched against a sequence database and found to be unique HGBV sequences. The clones were then used to assemble the sequences T00129/30 (GB contig A and B) which encode the proteins R9435-47 (the 3 possible coding strand reading frames) and R82072, respectively. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection.

Mean 28.995; Variance 36.679; scale 0.791

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SOURCE KEYWORDS ORGANISM

Mus musculus antigen.

house mouse.

Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata;

Statistics: Mean 7.583; Variance 2.828; scale 2.681

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

K01700 Jenkins, J.R., Rudge, K., Redmond, S. and Wade-Evans, J. Cloning and expression analysis of full length mousencoding the transformation associated protein p53 Nucleic Acids Res. 12 (14), 5609-5626 (1984) products and the adenovirus Ela proteins. All three of these proteins are rich in proline, contain proline runs or clusters, and are localized in the nucleus of transformed cells. The Ela proteins and p53 have been shown to have very short half-lives [2]. The Pennica, D., Goeddel, D.V., Hayflick, J.S., Reich, N.C., Anderson, C.W. and Levine, A.J. The amino acid sequence of murine p53 determined from a cDNA clone Virology 134, 477-482 (1984) A single gene and a pseudogene for the cellular tumour antigen p53 Nature 306, 594-597 (1983) Mus musculus DNA-binding protein; antigen; p53 gene; tumor antigen. Mouse embryo F9 carcinoma cells, cDNA to mRNA, clones p422, p208 [1], and clone pp53-1 [2]. sequence of cDNA in [1] The murine p53 protein is similar to the avian and human myc gene 86072076 84068204 Zakut-Houri, R., Oren, M., Bienz, B., Eukaryota; Animalia; Chordata; Vertebrata; Mammalia; Theria; g200204 Data kindly reviewed (19-FEB-1986) by A. Upstream of this position the two sequences deverge totally and no homology can be observed; downstream of here the two sequences differ by only 4%. The differences are due to substitutions and to some small deletions or additions in this gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zakut-Houri,R., Oren,M., Bienz,B., Lavie,V., Hazum,S. and Givol,D. A single gene and a pseudogene for the cellular tumour antigen p53 Nature 306, 594-597 (1983)
